 Hi All,
<p> currently I am writing a package of software that for some reason
has to keep track of the currently active colortable. To give the
user a chance to adjust this table, I am calling (since it all has
to be GUIfied these days...) xloadct - but xloadct itself does not give
back the number of the loaded table.
<p> Does anybody know how to comfortably obtain this number?
I know there is XCOLORS which might help via an event, but I'd rather
rely on standard functions...
<p> thanks
<p>   M. Feldt
