There are various colorbar routines around on the web. I have one (called COLORBAR) on my web page that is specifically designed to work the same on the display and in PostScript output.

You might have a look at some of the Perfect PostScript articles there as well. Many things can cause your PostScript output to look different from your display output. The articles will show you how to sort it all out and produce pretty much WYSIWYG output.

Cheers,

David
