Subject: Another strsplit question

Most functions in IDL will operate on arrays.
Is there a way to make strsplit allow this?

e.g.
s = ['I see the computer.','I am typing a message.',$
'This is the idl-pvwave newsgroup.']

segs = strsplit(s,/extract,/some_option)

print,segs[0,0],segs[1,0],segs[2,0],segs[2,4]

RESULT WOULD BE:

I I This newsgroup.
