Hi,

We have organised our library into nearly 40 subdirectories.

On the workstation side all routines are launched very fast in contrast to the PC's.

The PC's are connected via samba to the library. Normally samba is faster than nfs.

At the moment I believe that's in idl5.02 for PC is a bug in searching through the path for routines.

One of our Pentium 166MHz, WIN NT, 80MB RAM and idl5.02 takes more than 2 minutes in searching 60 routines.

A very old one of our Workstations with 66MHz and 64 MB takes only 30 seconds.

Who can give me an idea to speed up the PC's
