Hi!

WIDGET_INFO does not know this keyword. I think it should, what about you? As I see it there is no possibility to find out whether a nonexclusive button is selected or not.

Okay, this is not really a problem. I either use CW_BGROUP, or I assign an event handler, and whenever the button is pressed / released, I store event.select in the widget's uvalue. But shouldn't this be done easier? And did anyone yet need WIDGET_CONTROL, GET_VALUE to get the _text_ of a button?

Or am I, as so often, just missing something?

Just wondering,

Alex
