
Subject: Weird error in RPC source file collection.

Has anyone out there ever simply followed the directions in \$IDL_DIR/external/rpc/README.TXT (copying the contents of that directory to somewhere, and then execute "make" in that directory) ?

Although building the idlrpc and libidl_rpc.so files is not normally required (they're available in the \$IDL_DIR/bin/bin.<OS_NAME>), I can't help but to be puzzled by an apparent error in "idl_rpc_obsolete.c": In all the calls to IDL_RPCStoreScalar there is an "&" missing in front of the last argument, which results in a compiler error on my system (Digital Unix).

Doing a search-and-replace (8 occurrences!) in idl_rpc_obsolete.c of

```
"type_s);" => "&type_s);"
```

fixes the problem, and everything appears to compile ok...

Puzzled - does anyone have any Insights to offer :-)
