
Subject: IDL-Fortran String/Char Passing

Hi there. We are doing some idl development which is using some fortran routines. Does anyone out there know how to pass character data from idl to fortran and vice versa? I know how to do integer and real data, no problem. Examples of working code would be VERY welcome.

Also, anybody else notice that the new HDF interface in IDL is REALLY slow as compared to C or Fortran.

Thanks in advance.
