Hi all. Me again. Six months ago I had posted asking for advice on how to register data. I got lots of good responses. However, the process of finding the tiepoints is still painful (at least the way I'm doing it).

What I'm interested in knowing is if anyone has written anything in IDL to do registering with tiepoints, but with an interface allowing you to pick your tiepoints with the mouse...or something like that. Keep in mind that I'm trying to register together airborne data and satellite data.

Come to think of it, if there something like this that ISN'T IDL, I'd still be interested in hearing about it.
