IDL already exists for Solaris 2, and PV-Wave is launched on the 30th June,  
as is PV-Wave advantage which is PVW-CL with the IMSL stuff bolted on, so  
it's a bit better at stats and maths than vanilla PVW (and more expensive  
too, of course).

I've currently got IDL Sol 2.1 version evaluating under 2.2, and the widgets  
are a bit wonky, especially if you use a pointer focus rather than a click  
focus for windows, but RSI know, and are (hopefully) working on it.

Pete.
