I have two problems:

1)How can I plot x axis:left large,right small.That means x axis decreases from left to right.(is there any keyword in PLOT routine that can do this or maybe I need to use Object Graphics?)

2)After I plots a graph,I use xyouts to put a text besides each point.But because some points gather together(they have nearly same value,so the texts gather together too.So it is difficult to distinguish these points and texts.Is there any methods which can rescue this?

Thanks
