Well, since we're on the subject and it seems to be a slow day on the
newsgroup,
one thing regarding axis drawing I've always been curious about is why the
tick labels
and axis titles get drawn backwards when you rotate a figure (I encountered
it with xsurface,
rotated through 225 degrees about the z axis). I can't really imagine a
time where you'd want
them drawn backwards, but then I've never been known for my imagination,
either.

Anyone know why it's done this way, and maybe even how to avoid it?
