It turned out in the end to be not as hard as I had thought. Once you
figure out how to -create- a new language mode using the menus, you can
just start using it and update it incrementally to fix things that you
have forgotten.

One suggestion I cribbed from the Fortran mode is to make the keyword
regexps FOR|[Ff]or ... etc. to get all reasonable capitalizations.
Otherwise, what I came up with is (naturally) quite similar to what others
have posted.
