Most of the contouring I do is of irregular data over a polar grid (the North Pole, to be exact). Thus, I make extensive use of triangulate and trigrid to interpolate the data into something contour can handle. Often, I have the problem that an anomalous line of zero data appears which starts in the middle and goes out to the right. I've determined that it is not in the original data but only in the interpolated data. It's not even close to the Greenwich meridian (where the data wraps around). Has anyone had any problems like this before with triangulate?

thanks,
pat
