Subject: IDL PostScript messes up printing graphics?

This problem has plagued me for years... Now it's come up again a bunch of times this week. I just want to find out if anyone else has seen this and if there is a quick answer. You may know how these things go: there are so many variables that no one else has the same environment, and doesn't see my problem. Anyway...

Sometimes when a user prints a PostScript job generated from IDL on one of our HP LaserJet III (resolution enhanced with Pacific Page PostScript cartridges and accelerators), subsequent print jobs have their graphics garbled. The subsequent jobs can be graphics in TeX or NCAR Graphics, for example.

Thank you for your time.
