Is anyone familiar using vector-drawn fonts
in the title keywords of the plot procedure,
in particular the use of special characters?!

I'm trying to display an acute above a vowel,
common in the french language, e.g.:

acute: ('), e' (well, the acute is above the "e";

So, I want:

```
plot,x,y,xtitle="!6 Lame"  
      ^^?
```

Hope this question is not too trivial, but I couldn't
find anything in the IDL manuals.

Thanks,

Martin
