Readers of this newsgroup may be interested to learn that a new version of the IGOR Pro scientific graphing and data analysis program is now available.

IGOR Pro 3.1 is the first version that runs on Microsoft Windows (95 and NT4) in addition to the Macintosh. (And no, we will not be dropping support for the Mac.)

Compared to matlab or IDL, IGOR Pro:

- is much less expensive
- is much more interactive
- has greater emphasis on publication quality graphics
- has greater emphasis on data analysis and curve fitting

To be fair, IGOR's support for matrix math is much weaker than matlab's and IGOR's support for image processing is not yet as extensive as dedicated programs such as OPTIMAS.

For more information and instructions for downloading a free demo version, please visit our web site,
