
Subject: Boxplots?

Before I reinvent the wheel, does anyone have IDL or Wave code they'd like to share that makes boxplots? These are plots that show aspects of the distribution of y for each x value -- the first and fourth quartiles form the ends of each box, the median is a line through the box, the mean is plotted as an x or other symbol, and the maximum and minimum are shown the same way error bars are usually represented. Each distribution is represented something like this:

```

-      |
      |
      |
      |
---    |
||     |
---    |
||     |
|x|    |
||     |
---    |
      |
      |
      |
-      |

```

You can reply to me directly or to the group.

Thanks,
