Subject: Data Handling

Posted by Neil Winrow on Tue, 21 Apr 1998 07:00:00 GMT

Can anyone please offer me any advice. I have a file containing several blocks of data. Each block of data contains the same amount of data.

```
indata = fltarr(5,100)
readf,10, indata
;define array size and read first block of data into array
```

Header info from each block of data seperates the data, so I need to skip over the header and read the next block of data, the number of data blocks cannot be determinded from any header info. So the problem involves having X number of blocks that need to be accessed at any time. If I use pointers to point to each data block then I can retrieve the data later, but I'm a little unsure how to go about this.

Many Thanks

Neil
