<HTML>

Hi IDL Experts

<P>I'm writing an IDL application and I want to create a button which starts a ftp-based file transfer automatically. The address of the host and the user name can be hardwired somewhere in the code.

I've tried to start ftp from the command line and I got the following error message:

IDL> \$ftp myhost

(myhost::myuser:) login: Access of user wdenied.

<P>Any hint on how to implement this feature is very appreciated by
