To the IDL users,

I am looking for a general purpose image analysis package (widget based) with intensity x- y-profiling, zoom, background manipulation, and filtering capability for example. The RSI home page listed some useful references, for example, the AIM package at LLNL, but I would think there must be many more programs out there... Please post useful/favorite references you might have.

Regards, Roger Dejus (dejus@aps.anl.gov).
