
Subject: Selecting a Visual Class

I run pv-wave 4.01 on RISC/6000 530H (AIX 3.2.3) and I have problems with color-handling: if try color_palette on different color-tables I always get black windows without figures or even colors. The same thing happens, if I try say plot,x, color=n -> nothing comes on. Page A-85 PV-WAVE User's Guide states that pv-waves looks for existing visual classes starting with Direct Color , 24 bit and so on and supports all. If I force device, pseudo_color=8 all is o.k. But how is it possible to support Direct Color, 24 bit, what's wrong, maybe I have overlooked something ?

Many thanks for help.

Helmut
