
Subject: Routine for converting 80x87 doubles to XDR (IEEE) format?

I'd like to read in some data dumped from a PC that includes some 8-byte reals. BYTEORDER only does byte swaps for shorts (2 bytes) and longs (4 bytes). If I recall, the 80x87 uses IEEE format, but with the "little endian" format of the Intel chip. Is that correct? If so, I just need an extended byte-order to do an 8-byte swap. If not, a canned routine to do the conversion would be nice.
