Subject: psym

Hi,

general we are using our idl scripts on Workstations and PCs.
For the most things we are able to adjust the screen output to the
postscript output.

But unfortunately I don't know how to find the correct scale factor
automaticly for the psyms by Workstation PC and postscript.

For text eg. we can use width=width to get the device independent size.

Is there a keyword like width available for the psyms?
Or what is the reason for those different sizes on different platforms.
