Hi all,

I just observed a very strange thing:

I tried (as root) to find out, where the bug occurs in the CW_FSLIDER procedure,

and then I closed the file again without changes.

After new compilation the problem went away !

I do not know why, but it works now on the LINUX-PC, but still not on the UNIX workstation, where I can not become root-user.

No idea, what happened.

Heiko
