
Subject: floating illegal operand->error

Hi all,

I've written a C program to resize an Image (i.e. resize a 2-D array).

I then use IDL to view the resized image. For starters I just have the program resize the image to the exact same dimensions as the original image (i.e. create an identical image). I am able to view this new image and it appears identical to the original image, however in addition, idl outputs the message "Program caused an arithmetic error:

Floating illegal operand"

Does anyone know what might be causing this error or what it means?

Thanks...

NOTE: I'm using the command-> fits_read, 'FILENAME', data, header to read in the image and then use tvscl to view the image.
