I am interested in using IDL to display 24-bit satellite images on a Sun workstation. After a very brief search, I have found 24-bit video boards for Suns (S-bus slot) are available from Parallax, RasterOps and Sun.

Is there any one out there who has experience in this area?

I would be interested in any comments on hardware, hardware that I am not aware of, how IDL interacts with the hardware and anything else that might be relevant.

Thanks in advance for any help.
