According to Technical Support at RSI, this problem is known to them and they are still in the process of trying to discover why some MPEG players have problems with the files created by IDL. They are pretty confident they are creating the MPEG files correctly according to the MPEG file specifications.

Until more is known, here is a list of MPEG players that was given to me by RSI that have apparently been tested and are known to work with the MPEG movie files created by IDL.

For Windows machines:

- ActiveMovie (<http://www.microsoft.com/directx/pavilion/amovie/default.asp>)

Version 2.0 and higher is recommended, but I find version 1.0 also works.

- VMPEG (<http://www.udel.edu/ps/sw/vmpeg.exe>)

There have been some problems with players dropping frames during playback. If this is occurring with your player, you may want to try this player, which is not susceptible to this problem.

For UNIX machines:

Xanim (<http://xanim.va.pubnix.com>)

Apparently source code is available for this viewer if you want to compile it for other platforms. See the web page for details.

For Macintosh machines:

Quicktime Player (<http://www.apple.com/quicktime/>)

Cheers,

David
