
Subject: Using map projections to display images

I'm trying to take digital air photo data with a known ground sample distance resolution and a single georeference point (taken from a GPS receiver) and display it in an arbitrary map projection. I have looked at the documentation for MAP_SET, MAP_IMAGE, and MAP_PATCH. Using the example provided in the documentation of MAP_PATCH, I have managed to get the image to come up in the right projection, but I am unsure how to keep the resolution of the image the same.

Does anyone have a good example to display an image warped to an arbitrary map projection? (perfered projection would be transverse mercator)

Thanks in advance for any replys,

Sean
