Hi folks

I'm are running IDL 3.0.1 under Windows 3.1 on a 486-50DX with 16 MB RAM and MS-DOS 5.0. I have the following problem with some (but not all) procedures:

If I want to run the compiled procedure (compiling gave no problem)

immediately after having started IDL, Windows reports a "protection violation in module IDL.EXE at 0001:A4F4" error and IDL stops. The only way to make the procedure run is to compile a different procedure first and to run it afterwards. In this case everything works just fine.

I think there is nothing special with the mentioned procedures (memory used and so on). They read some timeseries data from harddisk and plot them on screen or to a postscript file.

Any suggestions? Thanks in advance

Dan
