Halls

I'm working with big time series data sets (a number every 15 minutes
for a year ~35000 numbers).
They are completely not correlated, I mean, the sampling time is bigger
than the process characteristic
variation time, so I can't do any interpolation (or better I can but the
result would be completely
meaningless!!!, It would be as the interpolation of a big series of
random numbers).
Of course I don't have a monitor with enough pixels the visualize all
the data sets at the same time
and I'm looking for an interactive IDL5 programs where I can chose a
time point inside the data set
and then it plots the related data set sections (color bars or something
like that)

Do you know if such a program is available in any public IDL lib??

Thanks in advance
