Hi,
I am in the process of choosing a new workstation for idl image processing.
Does
anyone have any figures on idlspec results for alpha based machines running
NT4.0?
Either idlspec (http://astrosun.tn.cornell.edu/staff/jdsmith/IDLSPEC.html)
or just the output of time_test
would be useful.
Please use this thread also to report any other current OS + workstation
recommendations with idlspecs

thanks

Martin
