Hi,

I am in the process of choosing a new workstation for idl image processing.

Does

anyone have any figures on idlspec results for alpha based machines running NT4.0?

Either idlspec (<http://astrosun.tn.cornell.edu/staff/jdsmith/IDLSPEC.html>)

or just the output of time_test

would be useful.

Please use this thread also to report any other current OS + workstation recommendations with idlspecs

thanks

Martin
