Well, I did what David told me, and of course it works:)

The added "event.top" line I understand, sloppy of me, bad Doug!

The second part with the "Widget_Info" still confuses me as to why it works.

With the destruction of the top-level base preceding the SET_UVALUE, how does PickFinish ever know what was done to the values in the pickPtr? I guess I

still have not grasped this whole event driven style of code yet.

Would it be better to have the destruction "percolate up" to a handler for

the pickTLB? If so, how do I do this?
