Subject: Q: How to delete 'active' procedure?

---

I've been getting very frustrated with IDL lately. I keep having to quit & re-start pv-wave because I can't DELPROC my procedures after they've been used.

When I just compile a procedure, I can delete it, but if I use the procedure it becomes an 'active' procedure and DELPROC refuses to delete it.

I'd like to be able to write a procedure, test it, fix a bug, and test it again without having to quit & re-start pv-wave.

Any comments on how that's done ?

-Randy
