
Subject: Postscript output from map_image/map_set

I am setting up a graphics window with map_set and am laying a graphic on the map with map_image (and bytscl), then plotting the same data over the graphic, and I am using aspect.pro from David Fanning's site.

Though the graphic in the window looks fine, somehow the postscript output is flawed. The contour graphic is not the same size as the image graphic. I tried different settings on aspect.pro and also pswindow.pro (also from David Fanning's site) to no avail.

I tried write_gif and write_jpeg, but the resulting bitmap seems to have every row shifted a few pixels giving a stretched out result. How can I get a portable color graphics output ?

Help, I have a presentation to give tommorrow!!

Amit Ghosh
