I have the original data, however, I am not ortho-rectifying. I am taking the yaw, pitch, roll, and air speed of the aircraft out of the data. This results in enhanced spectral distinction.

I would love to hand my end users distorted images with good ROIs of items of interest. Unfortunately the software that corrects the GPS cannot include the ROIs with it since the GPS data is interlaced within the sensor data.

Since this could be a show stopper for my program, we may need to contract with RSI to develop my MNF Masking button.

Thanks for you help.

Dan
