IDL folks,

Hi. I'm on a quest to find a widget based procedure that allows a user to navigate through a directory structure and select files, which are added to a file name list. When the user has selected all the files and exits, the widget returns an array with the file names (complete with path info.). I guess what I'm after is something like `dialog_pickfile`, but for multiple files. I figure this must already exist out there, but so far I haven't found anything. Thanks in advance for any help!
