Subject: curvefit hang-ups ?????

Hi everybody,

has anybody ever had the following problem of with the CURVEFIT procedure?

I am trying to fit a not too complicated analytical function to some data, but sometimes

the CURVEFIT procedure just stalls on me. Admittedly, that is when the data does not

look too much like the shape of the analytical function I am trying to force it to, but I

thought there is an error message for non-convergence.

Also, when I just interrupt the process, iter = 2, which indicates that the routine

is stuck after the second iteration step, doesn't it?

Well, any input would be much appreciated.

Thanks,

Jens Redemann
