Subject: Running IDL programs from CGI/Perl on windows NT

Hello,

I am trying to call IDL from a cgi - perl program, mainly to be able to run
IDL from the web and return either plots or images as GIFS. I have seen such
programs for Unix (ex. Jason Mathews), but not for windows NT. Can anyone
help me to create a command line in perl if the IDL directory is:

C\Program Files\rsi\idl40
The executable file is:
in this dir and called idl32.exe

Say, I have an IDL program in the same dir called trial.pro.

Also, how can once run an IDL program from the DOS command line?

I would appreciate any help from anyone on this topic.

Thanks,
Mila Mitra
