---

I want to include some of my code in my thesis, so I need to be able to import the code into a document.

Does anyone know of a routine that will convert a .pro file to a document that preserves the syntax highlighting seen in the IDL window? Copying the code from within IDL 5.0 doesn't allow me to paste it into a word processor with its formatting intact.

I figure it would be possible to write a small program that would convert a source file into a rich-text-format document by searching for various keywords and inserting the appropriate format statements, but I don't really have the time to look into it.

Anyone have any suggestions?
