Subject: IDL with multiple processors
Posted by David Schmidt on Thu, 03 Dec 1998 08:00:00 GMT

We recently tested the speed of a non-graphical, numerical IDL code run
on two different Linux systems. The system with 2 350 MHz processors
and SDRAM was about the same speed or a bit slower than the system with
1 233 MHz processor and EDORAM.

Anyone else have performance problems/suggestions for multiprocessor
machines?

David
