Excuse me if this is a trivial question. If it is, just send the mail to my account instead of posting here. Here goes the question:

I am plotting the real and the imaginary part of a complex number in two subwindows and change the phase of the complex signal interactively.

When I change the phase fast I see a flicker in the plot. I would like to make it flicker free. Is there a way to just plot the data without redrawing the axis everytime (since the scale remains same)?

Thanks.
