---

I have just had my upgrade (FTP'd from RSI) crash my NT4.0 server - running SP4. Crashes with a blue screen - with problem in HASPNT.sty (or suchlike).

Removing the dongle did not fix the problem. Otherwise I am running a perfectly respectable AcerEntra pentium and had no trouble with V5.1.

I am scared to tempt yet another crash until someone can confirm this condition and fix it. I know I could probably recover with a ER disk - but hell, I don't like crashing my NT.

My updrade CD has just arrived from RSI - do I dare try this?

Mie Alport
