Hello,

This is a rather curious bug that I noticed after I upgraded to 5.2. Of course this may not be a bug but if I am being really stupid, please let me know.

```
IDL> print, !version
{ PowerMac MacOS MacOS 5.2 Oct 30 1998}
IDL> print, '0000FF'x
255
IDL> print, '00FF00'x
-256
IDL> print, 'FF0000'x
16711680
```

Shouldn't '00FF00'x be equivalent to 65280? Is this behavior also repeated on other platforms?

- Saeid
