
Subject: problem printing color line plots on HP printer

IDL folks,

I've created an IDL program using IDL 5.1 on Windows 95 where plots with different colored lines are sent to the printer using the `set_plot,'printer'` method. The color printouts look fine when sent to a Tektronix printer, but the HP ink jet printers seem to print the line colors only in red and black. I can't figure out what the problem is, so I was hoping someone here might be able to help me out. Any help would be greatly appreciated. Thanks in advance!
