Hello all,

I am having problem with the DRAG keyword to the CW_FSLIDER function. When using this slider I want to see the values change as I slide the slider button. This feature is described in the help section under the keyword DRAG. According to the help section by setting /DRAG, I should be able to see events as I drag the slider button. And, in fact, this works as described in the WIDGET_SLIDER function using the same keyword. Unfortunately, I need to use the floating version of this function. BTW, I'm using this to build a tool for interactively changing the greylevels of a displayed image. Anyone out there already done this? Thanks for your help.

P.S. I'm still looking for the double slider if anyone has it.
