CIRA recently started ingesting EMWIN data. This is National Weather Service data stream transmitted via the operational GOES satellites or independent radio towers around the country. The data are the NWS forecast or current conditions in ASCII text files, GIF and JPG imagery, or UTF graphic format.

I was wondering if anyone has a read routine to work with the Universal Transmission Format (UTF) with the AFOS graphic products.

You can access these files (GPH*) at <ftp:\\emwin.cira.colostate.edu>
