Subject: supress axes

Hello all,

I want to supress the axes on a shade\_surf plot. I see that I can use [xyz]style = 4 to do this, but I am currently using [xyz]style = 1 to force my axes to a certain start and stop value. So when I set [xyz]style = 4, my axes' lengths revert to IDL's defaults which is undesireable. Is my only option creating a new set of axes to match the old axes from shade\_surf with the AXIS procedure and set these to the background color (which seems a pain) or is there something simpler I am missing?
