
Subject: time_test(2) and Linux

Hi,

I suspect that this has already cropped up and I have missed the post.
But just in case:

Running time_test or time_test2 under IDL 5.2 on a pc running Linux
(Redhat 5.1) appears to cause the individual benchmark times to be
rounded up/down to whole seconds. The final cummulative total is the
sum of these rounded numbers.
