Dear all,

I'm realizing an interactive satellite image processing system using IDL and the ENVI high level function.

I have to visualize several arrows in a particular region of the image.

I need to draw the arrows in all the three standard output ENVI windows (scroll, display and zoom).

Given the pixel-lines coordinates of the arrow I would put them in all the three windows.

Do you have any suggest about that ?

Do you to know the relation between the coordinates of the three windows, or if is there a method to automatically update the displays when only one has been addressed?

Cheer,

nando
